

# CADWorx Data Tracker

The easy and efficient way to keep your project manageable.

CADWorx® Data Tracker has been developed to assist Intergraph® CADWorx users to view, edit and use the database information in a CADWorx project.

## New Project Wizard

Set up a new project database and configure all the fields and tables. Set up a Model directory structure to organise your models more efficiently and select the specifications required for the project. CADWorx Data Tracker will automatically determine any associated data files required and copy these to the project directory that you have designated.

## User Access Rights

Define secure individual user access on a per project basis. Each user accesses their own manager-customised CADWorx Data Tracker features. Project information can also be set to read-only where required.

## Project Log

Keep in control by tracking which users are accessing the project and the actions that they are performing. Report on this Project log to confirm users' actions, including the time and date that each action was performed.

## Fully Configurable Data Input Forms

Project Data Input forms can be configured by adding text boxes or drop down lists. Any fields in the project database may be mapped to these text boxes/drop down lists. Individual items can be set to read-only if required, avoiding any unwanted changes. Form configuration is saved on a per project basis, in an XML configuration file. Data for components can be input using these forms. CADWorx drawings are subsequently synchronised with the updated database, reflecting all changes.

## Export and Import Reports

Reports are configured using a simple wizard interface - simply select the fields and criteria on which to report. Each report configuration is saved in the individual project XML configuration file. Reports can be exported in an Excel format, using an XLT template file if required. Reports can also be re-imported into the project database, incorporating any changes that have been made.

## Revision Control

Create project revisions, with any additional project files including drawings, reports etc, to give a snapshot of the project at any point in time. These revisions can be compared with each other and the Live Project, to determine any new, changed or deleted items. The results of each comparison are output to an Excel spreadsheet with the differences highlighted.

## Application Areas

Plant Design, Equipment, Petrochemical, Chemical, Offshore, Food, Beverage, Brewing, Pharmaceutical, Water Treatment, Building Services and Shipbuilding.

## Technical Specs

- Microsoft Windows XP Pro,
- Windows Vista Ultimate (minimum)
- Windows 7
- Microsoft Excel 2003 or later
- Microsoft Access 2003 or later
